

Bierman SEO + Attribution System Brief

From search visibility to center-level inquiry attribution

Search is working. Attribution is breaking.

The core finding: visibility is strong, but downstream tracking loses the signal.

What's Working

513

Search-driven active clients all-time.

25.8%

GMB active rate — the highest of any channel.

The Gap

Off-Site

GBP activity bypasses GA4 entirely.

6,419

Call attribution gap requiring reconciliation.

Governance

The next phase is data governance, not more traffic.

Technical SEO warnings were real, but not the main business-impact lens.

The audit did not dismiss technical issues; it reframed the priority toward revenue.

Technical SEO Warnings

- Crawl errors and 404s
- Indexation bloat
- Core Web Vitals / Speed
- Schema markup gaps

REFRAMED TO

Business Impact System

- Local visibility (GBP / Maps)
- Off-site conversion capture
- Attribution reconciliation
- Center-level outcomes

Search is the acquisition engine.

GMB, Organic, Paid Search, and AI/LLM are different surfaces of the same search ecosystem.

The Hidden Channel

GMB was previously hidden under "Offline Sources". When properly attributed, it is the single largest driver of active clients.

The original audit thesis holds: search visibility is strong. The challenge is capturing and correctly attributing that intent as it moves off-site.

A meaningful share of local intent happens before or outside the website.

GA4 does not see calls or directions unless the event is routed through CallRail/HubSpot or campaign tracking.

Review depth is not keeping pace with local demand.

High visibility without trust markers creates conversion friction.

The Danger Zone

Locations like Mason, Danvers, and Blue Ash are generating significant search interactions but have zero reviews to convert that intent into trust.

The Friction Point

When a family finds Bierman via "autism centers near me" but sees no reviews, they are more likely to abandon the journey before calling or clicking to the website.

HubSpot can be the outcome source of truth.

The governance layer makes the data decision-ready.

The gaps exist between visibility and the CRM.

Mapping the open loops to the inquiry timeline.

Ramsey + Piscataway: A controlled visibility-to-inquiry pilot.

Test the full attribution chain at two locations before scaling the playbook.

Three decisions. One clear sequence.

Addendum delivery → Pilot approval → Second-wave rollout.

01

Approve Addendum

Integrates new CRM and GBP evidence with original audit for client delivery.

02

Approve Pilot

Ramsey + Piscataway, 60–90 day window to test the full attribution chain.

03

Second-Wave Sequence

NJ second wave, cross-market review-gap wave, strategic markets.

NOT ON THIS PATH: ~~Full-site-rebuild~~ ~~URL-restructure~~ ~~Agency-replacement~~

The system is already producing active clients. The goal is to govern and measure it better.
